The research activity aims to determinate inorganic, priority and emerging organic micropollutants (POPs, both target and new generation PFASs, and their precursors) in different environmental matrices (aerosol, water, snow, ice, sediment) sampled both in urban areas, such as the Venice Lagoon, and remote ones (Arctic). The main goal is to investigate the spatial distribution of those chemicals and, thanks to already acquired data, their temporal distribution. Spectroscopic and chromatographic techniques will be employed (GC and HPLC), coupled to low-resolution, high-resolution, and tandem mass spectrometry.
